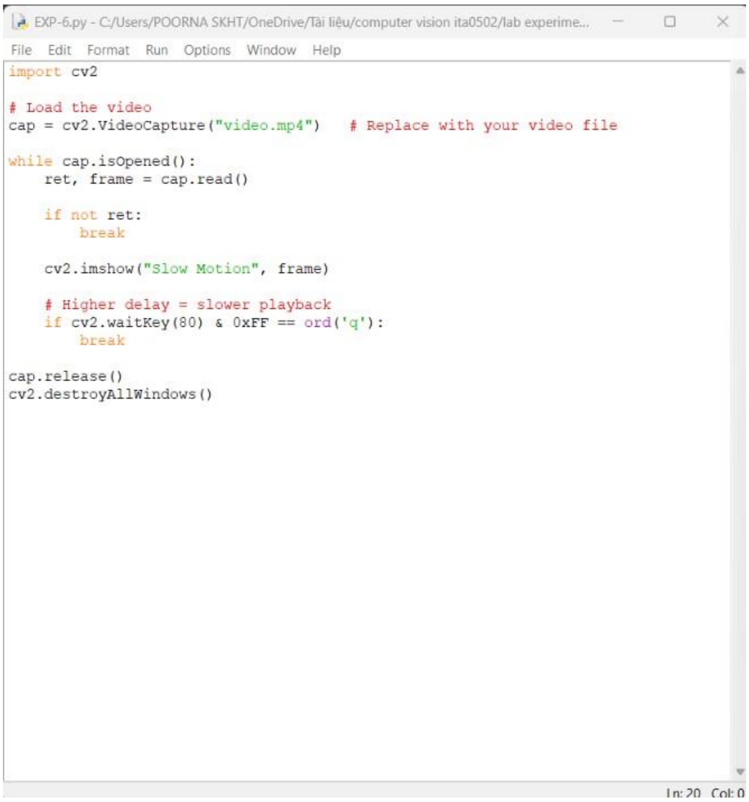
AIM: Perform basic video processing operations on the captured video

- **Read captured video in python and display the video, in slow motion and in fast motion.**

Algorithm:

- Import OpenCV and open the captured video using cv2.VideoCapture
- Read the video frame by frame in a loop using cap.read(), and display each frame with cv2.imshow().
- For **normal playback**, use the original frame delay based on the video FPS.
- For **slow motion**, increase the frame delay or write/show frames with a lower playback rate.
- For **fast motion**, decrease the frame delay or skip some frames so the video plays quicker.

CODE:



```python
import cv2

# Load the video
cap = cv2.VideoCapture("video.mp4")   # Replace with your video file

while cap.isOpened():
    ret, frame = cap.read()

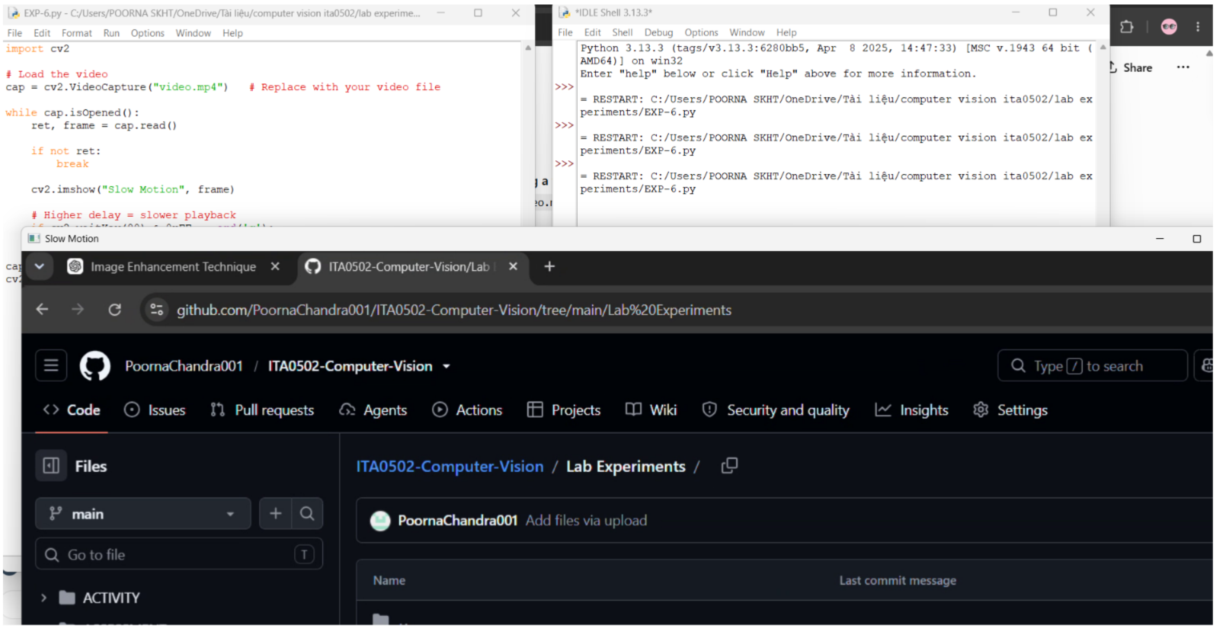
    if not ret:
        break

    cv2.imshow("Slow Motion", frame)

    # Higher delay = slower playback
    if cv2.waitKey(80) & 0xFF == ord('q'):
        break

cap.release()
cv2.destroyAllWindows()
```

OUTPUT :



RESULT: The input video was successfully displayed in both slow motion and fast motion using Python and OpenCV.
